

To whom it may concern,

By now you will have obtained my basic information and credentials from my resume so there is no point in mentioning those here. I am currently in my third year in undergraduate computer science. I am looking for a relevant internship as part of my graduation requirement, but this is for great personal interest as well. Last summer I worked as a both frontend and backend android developer for SilentSol (a software house in Islamabad, Pakistan) and now I am looking forward to joining your team this summer and fulfill this desire as well as take a great leap in my career development.

Besides that, I am a simple, team oriented and sportsmen-like (sports is my other passion. Football, cricket, and table-tennis if you would like to know) individual. I like to take initiative and think outside the box, which is why I have been at the forefront of the organization of many mega events at our university (METU NCC) such as cultural nights, got talent shows, sports tournaments, etc. All this attests to both my teamwork spirit and creativity since I have been involved as the media & marketing head in multiple of these events which has taken me on the route to create multiple solid and productive teams. I am currently also working as part of our university's UAV team. The major project is a fixed-wing autonomous fire-detection drone. We are currently working on the machine learning model for that drone which will eventually help it to autonomously detect fires. This one project has helped me develop my determination, perseverance, and spirit to achieve since it requires a lot of innovative ideas and testing on our part. During this project, we have faced multiple failures per every success which has taught us a lot and will personally help me in any real-time work environment.

I hope you consider my application. Hoping for an invitation.

Regards,

Maryam Imran
